Hiring Team, Sanas

Re: Software Engineering Intern – Bangalore

Dear Hiring Team,

I'm writing to apply for the Software Engineering Intern role at Sanas. I'm a final-year B.Tech Computer Science student at DBATU, and I've spent the last several months building full-stack products and working hands-on with LLM pipelines — which is exactly the combination your Speech Intelligence platform seems to need, from the desktop client through the Portal to SCI and insights.

As an AI Developer Intern at Blue Planet Info Solutions, I owned frontend architecture on two client-facing projects, building with React, TypeScript, and FastAPI, and integrating REST APIs under real production deadlines — the same shape of work as owning a scoped ticket end to end, from design through code, test, and review. At Ethara AI, I worked on LLM fine-tuning pipelines: cleaning and structuring domain-specific datasets, annotating thousands of samples, and running exploratory data analysis to improve training quality. That work sharpened both my debugging instincts and my comfort reasoning about data-heavy backends, which I understand is central to how your team ships.

On the AI side, I've gone further than coursework: I built a schema-in-prompt to JSON-mode to Pydantic validation pipeline for structured LLM output, and a separate mini-project evaluating LLM responses for relevance, correctness, and clarity while comparing prompting strategies and analyzing hallucinations — work that maps directly to your nice-to-have around LLM prompting and evaluation. I also independently built and won multiple competitions with MEDIASSIST AI, an end-to-end healthcare platform using the Gemini API, Python, and FastAPI with OCR-based prescription digitization and report summarization, which took me from a rough idea to a working product judges trusted enough to award.

What draws me to Sanas specifically is the pace and ownership: a small, senior team shipping production speech AI in-house, with interns given real tickets and real production exposure rather than sandboxed side-projects. I write clear, direct technical notes as a habit, not just when asked, and I'd welcome the chance to bring that same habit to your PRs and incident write-ups. I'd be glad to walk through any of this work in more detail.

Thank you for your time and consideration.

Sincerely,
Prem Borse
